

Belief Decoder Build Guide

Step 1: Create File

Create a new SwiftUI View called BeliefDecoderView.

Step 2: Copy Engine (IMPORTANT)

Copy the ENTIRE EmotionDecoderView including imports:

```
import SwiftUI
import UIKit
import AVKit

struct EmotionDecoderView: View {
    ...
}
```

Step 3: Rename Struct

```
struct BeliefDecoderView: View {
```

Step 4: Replace selectedEmotion

Replace ALL occurrences of selectedEmotion with selectedBelief.

```
@State private var selectedBelief: String? = nil
```

Step 5: Replace Emotion List with Beliefs

```
let beliefs = [
    "Worthiness",
    "Control & Safety",
    "Love & Connection",
    "Expression",
    "Vision & Faith",
    "Divine Alignment",
    "Boundaries & Identity",
    "Receiving & Abundance"
]

ForEach(beliefs, id: \.self) { belief in
    Button {
        selectedBelief = belief
        currentStep = 3
    } label: {
        Text(belief)
    }
}
```

Step 6: Replace Step 3 (Reflection)

```
if let belief = selectedBelief {
    VStack(alignment: .leading, spacing: 16) {
```

```

        Text("You have identified:")
        Text(belief)
            .font(.title2.bold())

        Divider()

        Text("Reflect gently:")

        Text("• When did this belief first take root?")
        Text("• Whose voice does this belief carry?")
        Text("• How has this belief tried to protect you?")

        Divider()

        Text("I acknowledge this belief with compassion. It no longer serves my highest good.")
            .italic()
    }
}

```

Step 7: Update Release Step

```
Text("Release the belief")
```

Step 8: Install New Truth

```

Text("Install your new truth")

if let belief = selectedBelief {
    Text("I am safe. I release this belief and step into a new truth.")
}

```

Step 9: Update Completion

```
Text("Belief Released:")
```

Step 10: Navigation Link

```

NavigationLink("Belief Decoder") {
    BeliefDecoderView(
        category: "Belief",
        count: 0,
        hasLayers: true
    )
}

```
